

DATATEGY × PIH · EVALUATION ACCESS

Agentium Showcase — Onboarding & Hands-On Guide

Welcome to your Agentium workspace. This note tells you how to get in, what you will find once your access is active, and where the topics you care most about live in the platform: **Flow Builder, Systems, replay, skills, observability, orchestration/automation (RPA) and data-source connectivity (SAP, Databricks, UiPath)**. A dedicated guided hands-on session with our team will follow — see section 5.

1 · Before you start — a note on releases

Agentium is a **live platform, in production at client sites** (Renault Group, Andritz, Société du Grand Paris, Mobilize Financial Services, among others). The Showcase workspace you are accessing runs on our SaaS environment, which follows a **continuous-improvement release cycle**: we are currently rolling out a new version, so some screens may be refined between your sessions. Two things will not change under you:

- **The mental model** (section 3) — objects, their relationships and the governance chain are stable.
- **Your data and flows** in the Showcase workspace persist across releases.

If a button has moved, the concept is still there — and telling us what you expected to find is exactly the feedback we want.

2 · Getting in

- You will receive a **personal invitation email** (sender: Agentium / Datategy). Follow the link to set your password — the login page is the branded Agentium portal.
- After login, check that the workspace selector (top bar) shows **Showcase** — your shared evaluation environment.
- Everything in Showcase runs on **synthetic or anonymised data**. Click, edit, run and break things freely: nothing touches any production system.

3 · The mental model — five objects, one chain

Everything in Agentium hangs off one canonical chain: **System** → **Flow** → **Run** → **Evaluation** → **Decision** → **Ledger**

Object	What it is	Where you see it
System	A governed business capability (e.g. “Contract Risk”, “Hydro Plant Insights”). Owns its flows, runs, metrics and evidence.	Portfolio / System 360
Flow	The executable definition — a visual DAG of typed skills assembled in the Flow Builder.	Flow Builder
Skill	A typed, reusable unit of work (query SAP, call an LLM, dispatch an RPA job...). Skills are what connectors contribute to the catalog.	Node palette / skills catalog
Run	One execution of a flow: stateful, resumable, fully traced (every step, tool call, cost) — and replayable.	Runs / Run detail
Decision / Gate	A human-in-the-loop checkpoint inside a run — with expiry rules, so a run never waits forever.	Run detail / inbox

System 360 shows each System through four perspectives — **Build** (flows & skills), **Operate** (runs & incidents), **Steer** (cost, value, ROI — the Hypervisor), **Govern** (decisions, audit evidence). Same object, four lenses: whatever evolves in the UI, this is the map.

4 · What you will find once your access is active

The Showcase workspace comes pre-populated, so there is something meaningful behind every door from the first login:

A portfolio of showcase Systems

The Hypervisor home lists governed business capabilities, each carrying its own flows, runs, cost/value metrics and audit evidence — explore any of them through the four System 360 perspectives (Build / Operate / Steer / Govern).

Ready-made flows in the Flow Builder

Demo flows — including an **SAP hydro insights** flow wired to a seeded HANA dataset — open as visual DAGs of typed skills. Node parameters (SQL statements, analysis questions) are inspectable and editable in place.

Run history with full traces

Past executions with their step-by-step traces: inputs, outputs, timing and cost per step, plus **Rerun** to replay any DAG and compare executions side by side.

A skills & connectors catalog

Typed skills contributed by connectors — e.g. `sap_hana_query_v1` (SAP HANA Cloud) and `rpa_dispatch_v1` (RPA Bridge) — alongside the **Models & Providers** portal with wired LLM providers and per-workspace routing.

Orchestration primitives

Trigger nodes (schedules, signed webhooks, file-arrival events), human decision gates with expiry rules, and a run inbox for long-lived processes. The RPA Bridge dispatches jobs through a generic REST contract (a mock orchestrator answers in the Showcase).

Feel free to browse and run what is there. For the structured hands-on part — building and modifying flows yourselves, replay scenarios, connector configuration — we will schedule a **dedicated guided session** with our team (section 5): it is the fastest way to get real value from the platform.

5 · Guided hands-on session — the next step

Rather than leaving you alone with a set of exercises, we propose a **live guided hands-on session (60–90 min)** with our team, scheduled at your convenience shortly after your access is confirmed. Agenda, driven by your priorities:

- Build and edit a flow end-to-end in the **Flow Builder**, and execute it live.
- **Replay** a run and walk its full trace — inputs, outputs, timing, cost per step.
- Configure a **connector** (SAP HANA Cloud) and see its skills land in the catalog.
- **Orchestration & RPA** — triggers, decision gates, and job dispatch through the RPA Bridge.
- Open Q&A on architecture, governance and your evaluation criteria.

Your Datategy contact (see invitation email) will propose slots. In the meantime, individual exploration of the Showcase is welcome — nothing you do there can break anything.

6 · Your focus areas — where each one lives

Your topic	Where to look	Status in Showcase today
Flow Builder	Build perspective → Flow Builder	Live — editable Node Inspector, Execute, run results in place
System / System 360	Portfolio → any System	Live — four perspectives (Build / Operate / Steer / Govern)
Replay	Run detail → Rerun	Live — DAG-level replay; certified replay with evidence file is the R&D axis presented in the deck
Skills	Node palette / catalog	Live — typed skills, connector-contributed

Your topic	Where to look	Status in Showcase today
Observability	Operate + Steer (Hypervisor)	Live — step traces, cost per step, portfolio cost/value/ROI
Orchestration	Triggers, gates, run inbox, memory	Live — schedules, webhooks, durable gates with expiry
Automation (RPA / UiPath)	RPA Bridge + rpa_dispatch_v1	Live via generic REST bridge (mock orchestrator in Showcase); the contract maps 1:1 to UiPath Orchestrator — dedicated UiPath profiles mobilise with 60 days' notice, per our RFI response
SAP connectivity	Connectors → SAP HANA Cloud	Live — encrypted config, test/query, demo dataset seeded
Databricks connectivity	Connectors rail	Same connector pattern (SQL endpoint); walkthrough on request — agents consume governed data products through Unity Catalog, as described in our RFI response

7 · Ground rules & support

- **Data** — synthetic/anonymised only. Please do not upload PIH production data to the Showcase tenant.
- **Licence** — time-boxed evaluation access; no commercial commitment implied.
- **Audit** — every action in the workspace is ledgered; inspect your own trail — that is the governance working.
- **Support** — one named Datategy contact (see invitation email) · guided session on request · feedback goes straight into the pilot design.

The same platform you are touching deploys unchanged to an Azure Qatar tenancy, on-premise or air-gapped — **what you evaluate is what you get.**
